Patient: Stella ROBYN ENRIQUES
MRN: 58000
DOB: 30/02/1949

Request No: 2500/00090
Service Date: 13/01/2025 at 14:44

MRI Lumbar Spine NR

MRI LUMBOSACRAL SPINE

CLINICAL HISTORY:

Past history of L4/5 fusion 2012. Well since surgery with right-sided pain.

TECHNIQUE:

1.5T high-resolution imaging.

COMPARISON:

Comparison is made with previous MRI lumbosacral spine study dated 17 June 2013.

FINDINGS:

The last completely unfused vertebral body has been designated L5 for counting purposes.

The conus medullaris terminates at the level of T12/L1 and this has a normal appearance. Post-surgical changes with posterior interpedicular screw fixation at L4/5 with decompressive laminectomy and focal distortion of the thecal sac. There is no recurrent disc extrusion. There is minimal grade 1 anterolisthesis of L4 on L5 but overall appearances have remained unchanged. There is disc desiccation at L4/5 but no significant central or exit canal narrowing is identified. Facet joint hypertrophy is also noted at this level. The rest of the levels are all intact. No prevertebral or paravertebral mass lesions.

Incidental finding of a suspected calcified uterine fibroid in the posterior uterine wall measuring 12 mm in size. No prevertebral or paravertebral mass lesion.

IMPRESSION:

Since the last MRI examination of 17 June 2013, similar finding of post-surgical changes L4/5 without definite features of exiting or descending nerve root impingement to account for the patient's symptoms.

Thank you for referring this patient.

Dr. Edmond How
Staff Specialist Radiologist
